Frost & Sullivan Recognizes Bosch for its Intelligent Parking Systems with the 2017 European Technology Innovation Award

BOSCH
Invented for life

Bosch's Automated Valet Parking (AVP) system earns Frost & Sullivan's Technology Innovation Award for its seamless solution in parking garages. A pioneer in automated mobility, Bosch developed a driverless system to save drivers the search for a parking space and the parking maneuver itself. The system finds an empty parking spot and the infrastructure sensors guide the vehicle to the space.

Compared to the competition, AVP does not require driver interference after initiating the parking maneuver and can already leave the parking garage, while the car is still on its way to the parking spot. The system eliminates accidents, making it the perfect solution for safe parking.

“Bosch’s AVP eliminates human error from the parking process, thereby simultaneously ensuring vehicle and human safety. Additionally, AVP makes entering and exiting parking spaces easier, benefiting parking garage operators, too.”
